|--|-------------|
| <b>CONTENTS</b>  | <b>i</b>    |
| <b>PREFACE</b>   | <b>xiii</b> |
| <b>I. FOUNDATIONS OF QUANTITATIVE GENETICS</b>                             | <b>1</b>    |
| <b>1. AN OVERVIEW OF QUANTITATIVE GENETICS</b>                             | <b>3</b>    |
| The Adaptationist Approach to Phenotypic Evolution .....                   | 3           |
| Quantitative Genetics and Phenotypic Evolution .....                       | 4           |
| Historical Background .....  | 7           |
| The Major Goals of Quantitative Genetics .....                             | 13          |
| The nature of quantitative-trait variation .....                           | 13          |
| The consequences of inbreeding and outcrossing .....                       | 14          |
| The constraints on the evolutionary process .....                          | 15          |
| The estimation of breeding values .....                                    | 15          |
| The development of predictive models for evolutionary change .....         | 16          |
| Mathematics in Biology .....   | 16          |
| <b>2. PROPERTIES OF DISTRIBUTIONS</b>                                      | <b>19</b>   |
| Parameters of Univariate Distributions .....                               | 19          |
| The Normal Distribution .....  | 26          |
| The truncated normal distribution .....                                    | 29          |
| Confidence Intervals .....   | 32          |
| <b>3. COVARIANCE, REGRESSION, AND CORRELATION</b>                          | <b>35</b>   |
| Jointly Distributed Random Variables .....                                 | 35          |
| Expectations of jointly distributed variables .....                        | 36          |
| Covariance .....   | 36          |
| Useful identities for variances and covariances .....                      | 38          |
| Regression .....   | 39          |
| Derivation of the least-squares linear regression .....                    | 39          |
| Properties of least-squares regressions .....                              | 41          |
| Correlation .....  | 43          |
| A Taste of Quantitative-Genetic Theory .....                               | 45          |
| Directional selection differentials and the Robertson-Price identity ..... | 45          |
| The correlation between genotypic and phenotypic values .....              | 47          |
| Regression of offspring phenotype on parental phenotype .....              | 48          |

|  |            |
|--|------------|
| <b>4. PROPERTIES OF SINGLE LOCI</b>                                  | <b>51</b>  |
| Allele and Genotype Frequencies .....                                | 52         |
| The Transmission of Genetic Information .....                        | 54         |
| The Hardy-Weinberg principle .....                                   | 54         |
| Sex-linked loci .....  | 56         |
| Polyploidy .....   | 57         |
| Age structure .....  | 60         |
| Testing for Hardy-Weinberg proportions .....                         | 60         |
| Characterizing the Influence of a Locus on the Phenotype .....       | 61         |
| The Basis of Dominance .....   | 63         |
| Fisher's Decomposition of the Genotypic Value .....                  | 65         |
| Partitioning the Genetic Variance .....                              | 69         |
| Additive Effects, Average Excesses, and Breeding Values .....        | 71         |
| Extensions to Multiple Alleles and Nonrandom Mating .....            | 74         |
| Average excess .....   | 74         |
| Additive effects .....   | 75         |
| Additive genetic variance .....                                      | 76         |
| <b>5. SOURCES OF GENETIC VARIATION FOR<br/>    MULTILOCUS TRAITS</b> | <b>81</b>  |
| Epistasis .....  | 82         |
| A General Least-Squares Model for Genetic Effects .....              | 85         |
| Extension to haploids and polyploids .....                           | 92         |
| Linkage .....  | 94         |
| Estimation of gametic phase disequilibrium .....                     | 97         |
| Effect of Disequilibrium on the Genetic Variance .....               | 100        |
| The evidence .....   | 103        |
| <b>6. COMPONENTS OF ENVIRONMENTAL VARIATION</b>                      | <b>107</b> |
| Extension of the Linear Model to Phenotypes .....                    | 108        |
| Special Environmental Effects .....                                  | 111        |
| Within-individual variation .....                                    | 112        |
| Developmental homeostasis and homozygosity .....                     | 116        |
| Repeatability .....  | 121        |
| General Environmental Effects of Maternal Influence .....            | 123        |
| Genotype $\times$ Environment Interaction .....                      | 127        |
| <b>7. RESEMBLANCE BETWEEN RELATIVES</b>                              | <b>131</b> |
| Measures of Relatedness .....  | 132        |
| Coefficients of identity .....                                       | 133        |
| Coefficients of coancestry and inbreeding .....                      | 135        |
| The coefficient of fraternity .....                                  | 140        |
| The Genetic Covariance Between Relatives .....                       | 141        |
| The Effects of Linkage and Gametic Phase Disequilibrium .....        | 146        |

|  |            |
|--|------------|
| Linkage .....  | 146        |
| Gametic phase disequilibrium .....                                       | 150        |
| Assortative Mating .....   | 153        |
| Polyploidy .....   | 161        |
| Environmental Sources of Covariance Between Relatives .....              | 162        |
| The Heritability Concept .....   | 170        |
| Evolvability .....   | 175        |
| <b>8. INTRODUCTION OF MATRIX ALGEBRA AND LINEAR MODELS</b>               | <b>177</b> |
| Multiple Regression .....  | 177        |
| An application to multivariate selection .....                           | 180        |
| Elementary Matrix Algebra .....  | 182        |
| Basic notation .....   | 182        |
| Partitioned matrices .....   | 183        |
| Addition and subtraction .....   | 183        |
| Multiplication .....   | 184        |
| Transposition .....  | 186        |
| Inverses and solutions to systems of equations .....                     | 187        |
| Determinants and minors .....  | 189        |
| Computing inverses .....   | 190        |
| Expectations of Random Vectors and Matrices .....                        | 192        |
| Covariance Matrices of Transformed Vectors .....                         | 193        |
| The Multivariate Normal Distribution .....                               | 194        |
| Properties of the MVN .....  | 195        |
| Overview of Linear Models .....  | 198        |
| Ordinary least squares .....   | 200        |
| Generalized least squares .....  | 202        |
| <b>9. ANALYSIS OF LINE CROSSES</b>                                       | <b>205</b> |
| Expectations for Line-cross Means .....                                  | 206        |
| Estimation of Composite Effects .....                                    | 213        |
| Hypothesis testing .....   | 215        |
| Line crosses in <i>Nicotiana rustica</i> .....                           | 219        |
| Additional data .....  | 221        |
| The Genetic Interpretation of Heterosis and Outbreeding Depression ..... | 222        |
| Variance of Line-cross Derivatives .....                                 | 226        |
| Biometrical Approaches to the Estimation of Gene Number .....            | 231        |
| The Castle-Wright estimator .....  | 233        |
| Effect of the leading factor .....                                       | 238        |
| Extensions to haploids .....   | 241        |
| Other Biometrical Approaches to Gene Number Estimation .....             | 244        |
| The inbred-backcross technique .....                                     | 244        |
| Genotype assay .....   | 246        |

|  |            |
|--|------------|
| QTL mapping by marker changes in populations under selection .....                   | 404        |
| Marker-based Analysis Using Nearly Isogenic Lines (NILs) .....                       | 405        |
| Marker-based introgressions .....  | 407        |
| Fine Mapping of Major Genes Using Population-level Disequilibrium .....              | 413        |
| LD mapping in expanding populations .....  | 414        |
| Candidate Loci .....   | 418        |
| The transmission/disequilibrium test .....   | 419        |
| Estimating effects of candidate loci .....   | 422        |
| Templeton and Sing's method: Using the historical<br>information in haplotypes ..... | 424        |
| Cloning QTLs .....   | 425        |
| Transposon tagging .....   | 426        |
| Positional cloning and comparative mapping .....                                     | 426        |
| <b>15. MAPPING AND CHARACTERIZING QTLS:</b>  |            |
| <b>INBRED LINE CROSSES</b>   | <b>431</b> |
| Foundations of Line-Cross Mapping .....  | 431        |
| Experimental designs .....   | 432        |
| Conditional probabilities of QTL genotypes .....                                     | 433        |
| Expected marker-class means .....  | 437        |
| Marker variance and higher-order moments .....                                       | 439        |
| Overall significance level with multiple tests .....                                 | 441        |
| QTL Detection and Estimation Using Linear Models .....                               | 442        |
| QTL Detection and Estimation via Maximum Likelihood .....                            | 445        |
| Likelihood maps .....  | 446        |
| Precision of ML estimates of QTL position .....                                      | 448        |
| ML interval mapping .....  | 450        |
| Approximating ML interval mapping by Haley-Knott regressions .....                   | 453        |
| Dealing with Multiple QTLs .....   | 457        |
| Marker-difference regression .....   | 459        |
| Interval mapping with marker cofactors .....   | 463        |
| Detecting multiple linked QTLs using standard marker-trait regressions .....         | 467        |
| Sample Size Required for QTL Detection .....   | 469        |
| Power under selective genotyping .....   | 474        |
| Power and repeatability of mapping experiments .....                                 | 474        |
| Selected Applications .....  | 477        |
| The nature of transgressive segregation .....  | 477        |
| QTLs involved in reproductive isolation in <i>Mimulus</i> .....                      | 478        |
| QTLs involved in protein regulation .....  | 478        |
| QTLs in the Illinois long-term selection maize lines .....                           | 479        |
| QTLs involved in the differences between maize and teosinte .....                    | 481        |
| QTLs for age-specific growth in mice .....   | 484        |
| Summary of QTL mapping experiments .....   | 484        |

|  |            |
|--|------------|
| <b>16. MAPPING AND CHARACTERIZING QTLS:<br/>OUTBRED POPULATIONS</b>  | <b>491</b> |
| Measures of Informativeness .....                                    | 492        |
| Sib Analysis: Linear Models .....                                    | 495        |
| A single half-sib family .....                                       | 496        |
| Several half-sib families .....                                      | 498        |
| Power of Nested ANOVA Designs .....                                  | 501        |
| A single full-sib family .....                                       | 502        |
| Several full-sib families .....                                      | 504        |
